

Updates on Regional Air Quality Issues in the Great Lakes Region

Zac Adelman

LADCO Executive Director

Presented at the FET Environment 2018 Conference
Pewaukee, WI

October 24, 2018

Isle Royale NP, MI

Boundary Waters Wilderness, MN

LADCO Background

- Formed in 1989 to bring Michigan, Indiana, Illinois, and Wisconsin together to address high ground level ozone in the region
 - Ohio joined in 2004; Minnesota joined in 2012
- Air pollution science, training, and planning support for the state (and tribal & local) air management agencies in the region
- Provides a forum to discuss regional air pollution issues
- Technical lead in the region for continental to urban-scale atmospheric modeling: meteorology, emissions, and chemistry-transport
- Current Events
 - New leadership as of September 2017
 - New modeling and business staff as of January 2018

Today's Talk

- Overview of recent air quality in the region
- Lake Michigan Ozone Study (LMOS) update
- Ozone transport – “Good Neighbor SIPs” for the 2015 O₃ NAAQS
- Research and planning support activities @LADCO

Energy Sector Changes Impact on Midwest Air Quality

US EPA Transport Modeling: Annual EGU SO₂ Emissions

Energy Sector Changes Impact on Midwest Air Quality

Energy Sector Changes Impact on Midwest Air Quality

Boundary Waters Canoe Area
Visibility on Hazeiest and Clearest Days

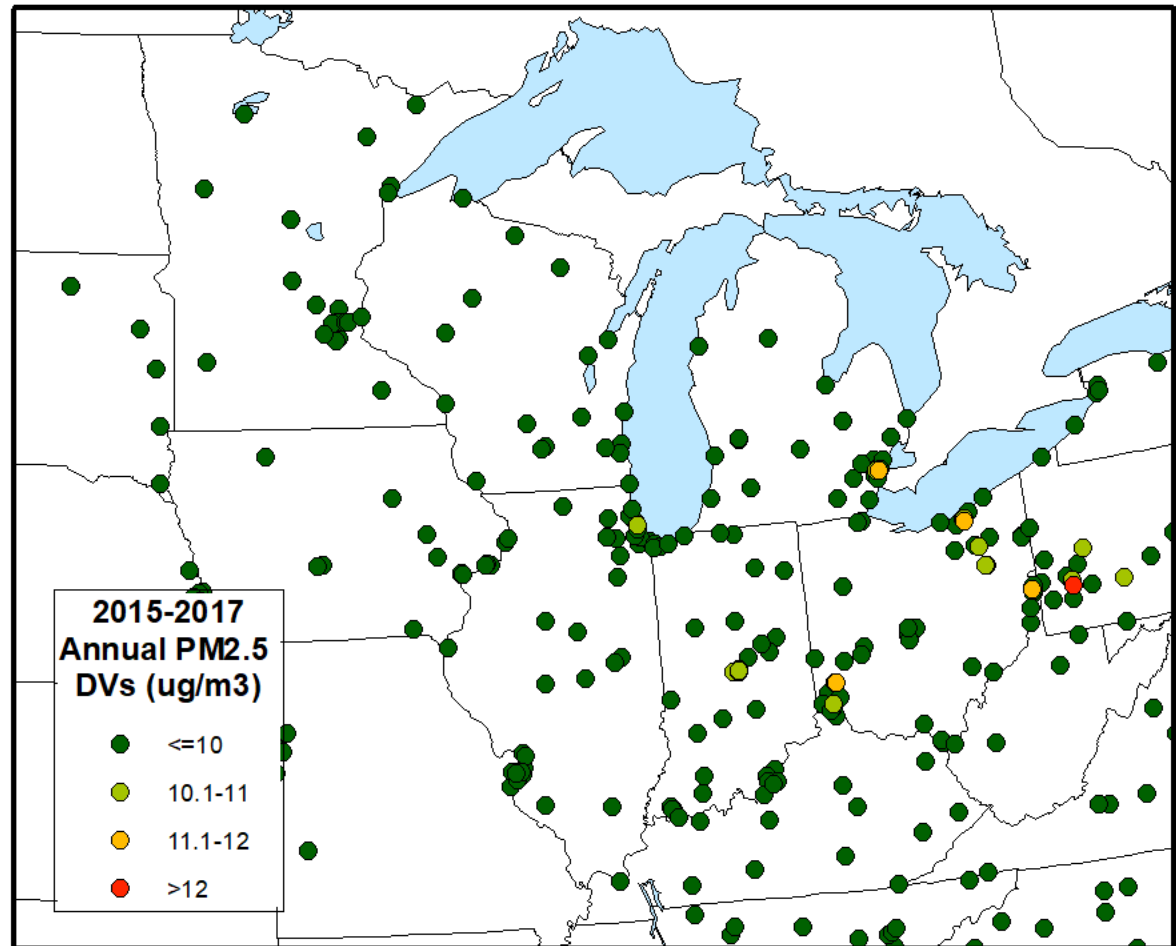

- Boundary Waters (MN) shows improvement in Most Impaired Days metric, starting around 2010
- 2011 to 2016 trend follows emissions
- Driven by NO_3 and SO_4

Western Shore of Lake Michigan

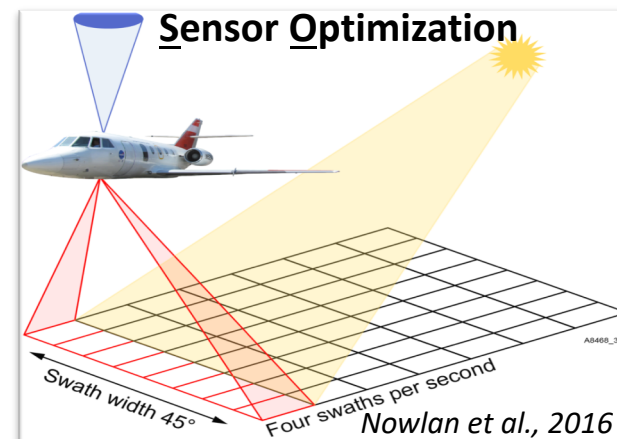

UNIVERSITY OF MINNESOTA

Motivations for LMOS

- Persistent high O_3 at some coastal sites
- Planning needs of the LADCO states require further clarity on regional O_3 production
- Last field campaign: summer 1991
- Need for a new study: New instruments/satellites and scarce aloft and over-lake observations

Geostationary Trace gas and Aerosol

Persistent High O₃ at Coastal Sites

LMOS Airborne Platforms

NASA GeoTASO remote sensing Flights

GeoTASO (Geostationary Trace gas and Aerosol Sensor Optimization) is an airborne NO₂ instrument that is being used as a testbed for future geostationary remote sensing platforms

Scientific Aviation insitu sampling Flights

Scientific Aviation Flights during LMOS provided vertical profiles of O₃, NO₂, CO₂, CH₄, altitude, T, RH, winds, and pressure.

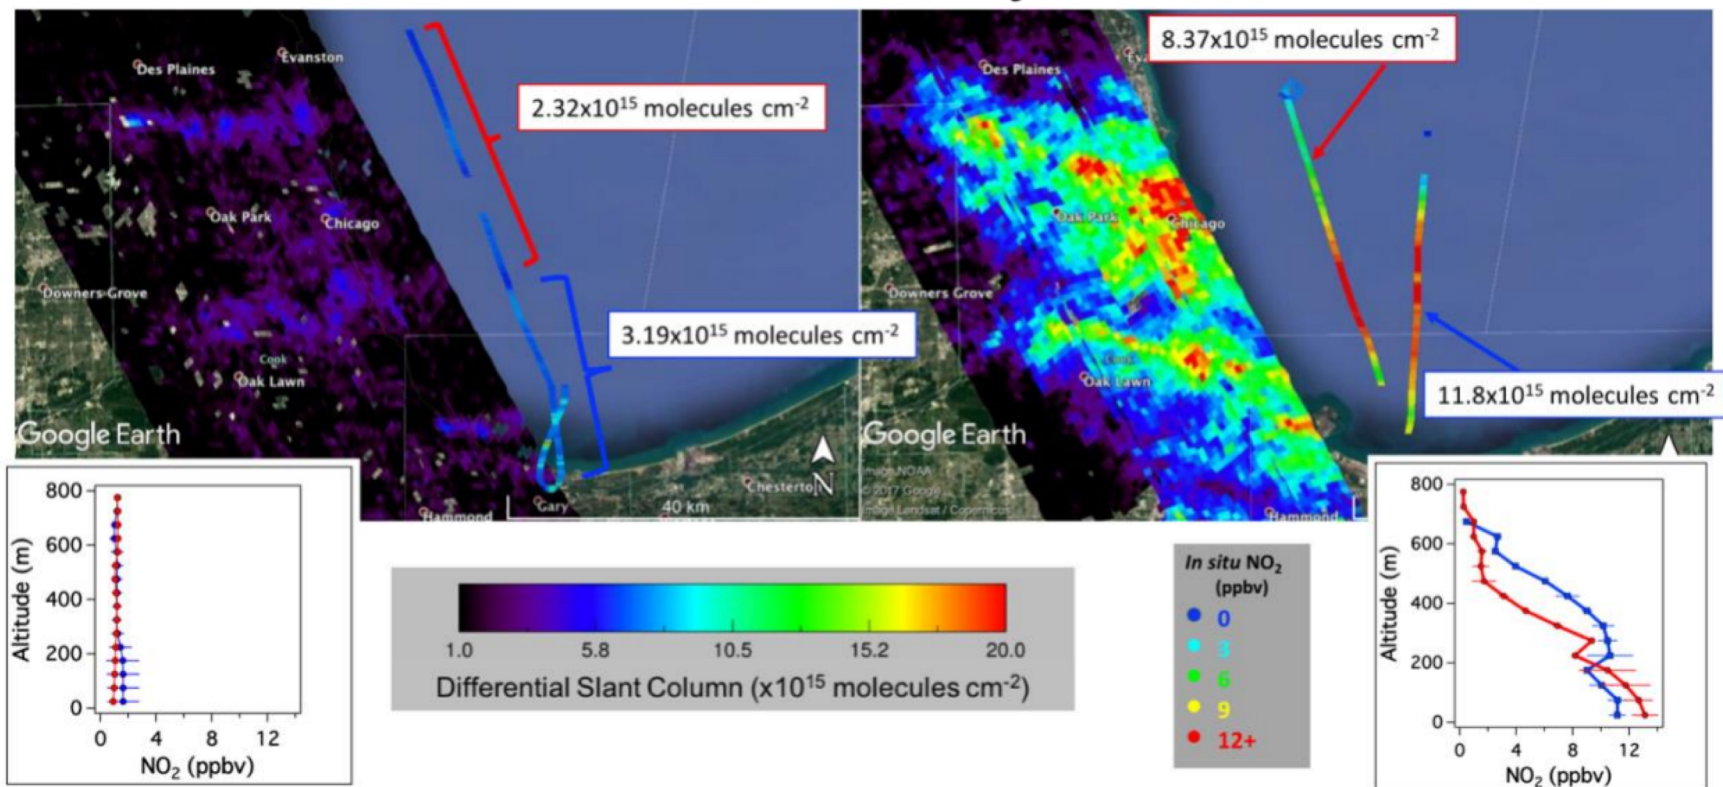

NASA GeoTASO LMOS NO₂ Retrievals

B. Pierce, U. Wisconsin

Preliminary LMOS Results

- Significant O₃ events occurred during LMOS 2017, with exceedances of the 70 ppb 8-hr ozone threshold on June 2, June 11-12, and June 14-16.
 - The LMOS 2017 aircraft observed polluted layers with rapid O₃ formation occurring in a shallow layer near the Lake Michigan surface.
- An experimental network of lower cost O₃ monitors (2B-POM monitors) was deployed over a 6 km area of Sheboygan to measure differences in concentrations with respect to distance from the lake.
 - Inland O₃ values were found to be 5-6% lower than the lakeshore site. However, intermittent data capture from these devices limits the drawing of detailed conclusions regarding spatial gradients.

Preliminary LMOS Results

- Modeling and observations during LMOS showed that the polluted layer over the lake is an important factor in coastal O₃ exceedance events
- Meteorological and photochemical model skill in forecasting these events needs improvement.
 - Models of the LMOS period underestimated peak O₃ concentrations and overestimated NO₂ concentrations
 - Model sensitivity studies show that reductions in anthropogenic NO_x emissions and increases in biogenic volatile organic compounds (VOCs) emissions are necessary to reproduce the observed surface O₃

LMOS Next Steps

- Meteorology and air quality model optimization for the Lake Michigan area
 - Integration of remote sensing and in-situ observations into simulations
- Mining the observational data for emissions signals
 - What can we learn about simulated emissions from the LMOS observations?
- Synthesis report for the field campaign available @ **ladco.org**
- LMOS data are now publicly available

<https://www-air.larc.nasa.gov/missions/lmos>

Regulatory Issues @ LADCO

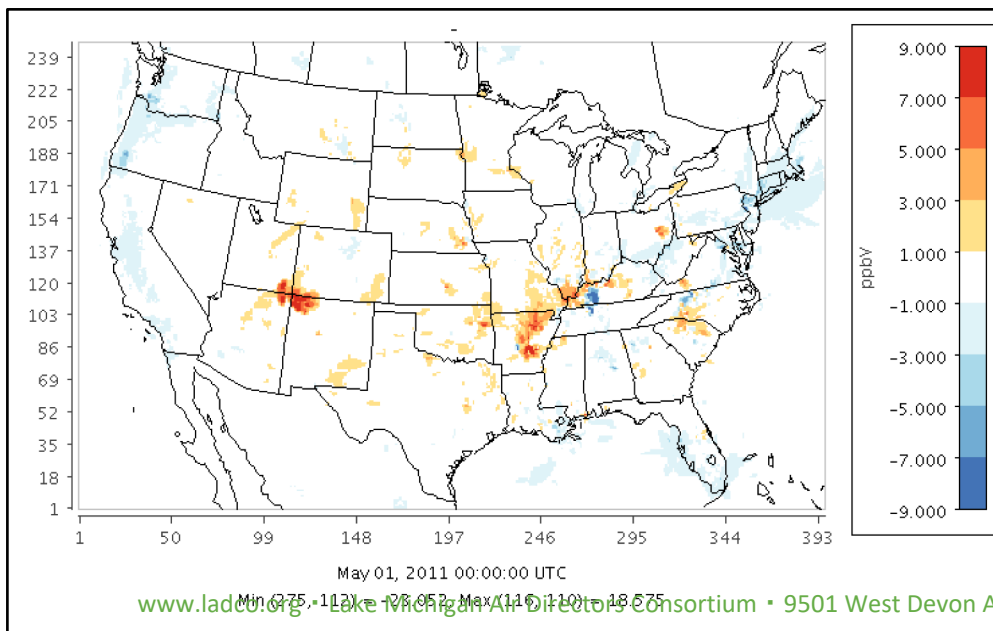

- **2015 O₃ NAAQS**
 - EPA designations finalized in August 2018
 - Marginal status for all violating LADCO monitors
 - iSIPs (including "Good Neighbor" SIPs) due October 2018
 - Attainment demonstration (SIP) not required for marginal
 - Marginal attainment by August 2021
- **2008 O₃ NAAQS**
 - Chicago and Sheboygan reclassification from moderate to serious status in January 2019
- **Regional Haze**
 - Round 2 SIPs due July 2021

2015 O3 NAAQS Transport Modeling

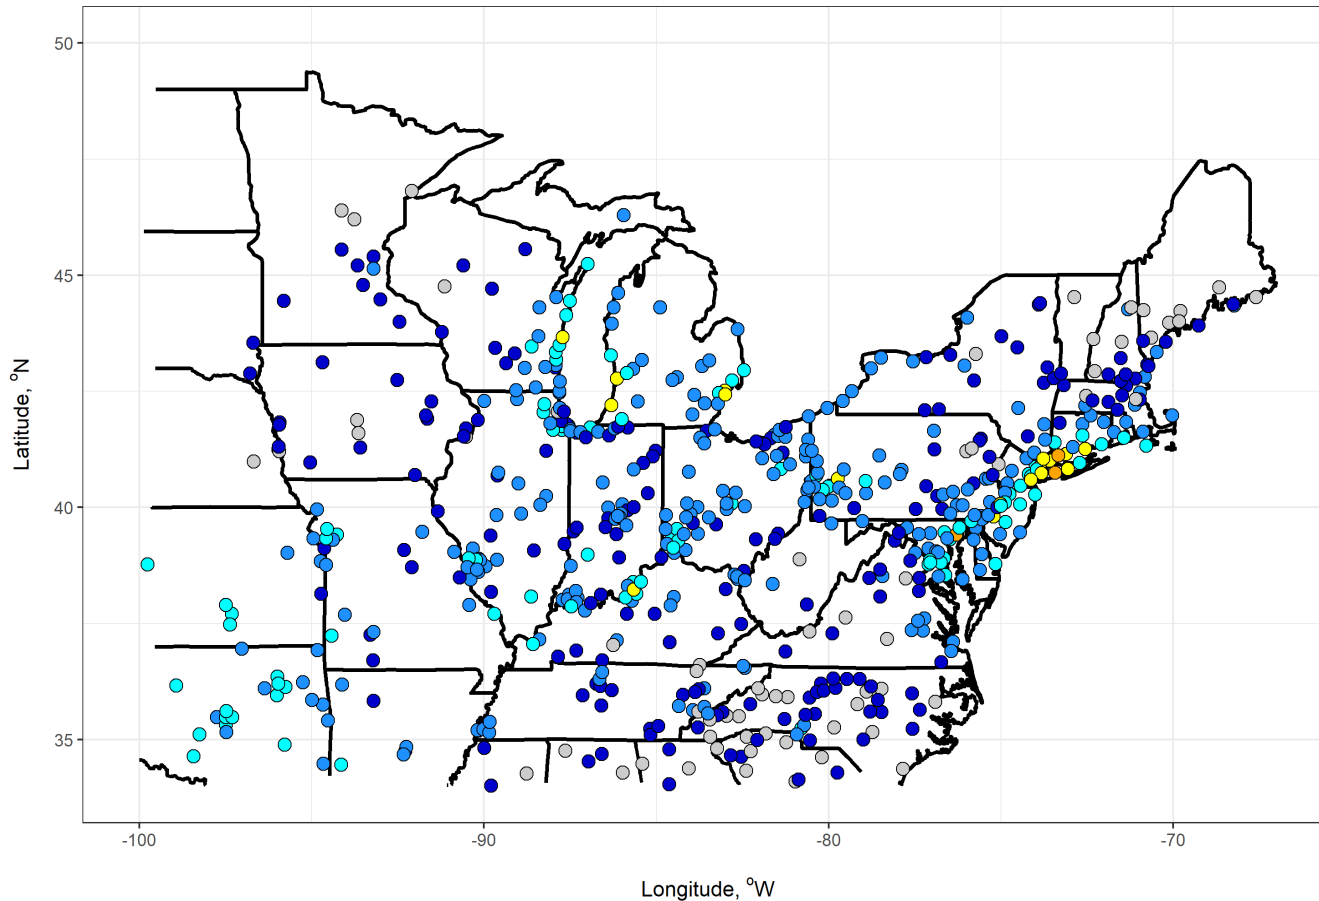

- LADCO reproduced EPA 2011 and 2023 CAMx regional modeling (“EN Platform”) as the basis of a transport modeling Technical Support Document (TSD) for our member states
- LADCO replaced the EPA electricity sector 2023 forecasts with ERTAC-EGU model projections; everything else the same with EPA
- CAMx used to tag sector and state contributions to 2023 ozone

EPA – LADCO
differences in 2023
daily maximum
MDA8 O3.

LADCO 2023 Ozone Design Values

O3 DV_avrg: 2023en

LADCO forecast 4 monitors in the Northeast to be nonattainment of the 2015 O₃ NAAQS by 2023

Contributions: Source Regions > 0.7 ppb

Contributions: Inventory Sectors > 0.7 ppb

O₃ Transport Modeling Summary

- Recent modeling studies (LADCO, EPA, MOG, TCEQ) forecast that most of the US will be in attainment of the 2015 O₃ NAAQS by 2023
- EPA Flexibility Memo (March 2018) laid out analysis alternatives for states to use for quantifying transport, source-receptor linkages, and maintenance
- First attainment deadline for 2015 O₃ NAAQS will use DVs for 2018-2020, to demonstrate attainment by 2021
- How will we get the forecasted levels of attainment?
 - The next three O₃ season (including 2018) temps are normal or cooler than avg
 - Emissions trends continue to decline along the slope that started in 2011
 - Lower than normal wildfire seasons
 - Long-range transport from outside U.S. flattens or declines

Technical Analyses @ LADCO

- Regional Photochemical Modeling
 - 2016 WRF/CAMx/CMAQ modeling for O₃ and Regional Haze
- Emissions Modeling
 - Inventory Collaborative
 - Analysis/improvement of mobile sources: onroad, offroad, rail, marine
- Meteorology Modeling
 - WRF optimization for high ozone conditions
- Exceptional Events
 - Studying smoke impacts on air quality in the region
